

Acknowledgments

We must first and foremost thank Bridget, Kate, and Terry for so generously sharing their time, expert insights, and informative resources that enabled us to write this book. It was a pleasure speaking with each of you, and we appreciate your willingness to coordinate across an ocean and multiple time zones to talk about your work.

We are also grateful for the editorial guidance of Mike Palmquist, and the Series Editors, Aleashia Walton, Jagadish Paudel, and Aimee McClure. Thank you, Mike, especially for your generous synthesis of reviewer comments into a clear roadmap for structural revisions, and for your vision of how our book would fit with the Practices & Possibilities series. Jordan Frith also reviewed an earlier version of our proposal, and helped shape our engagement with AI as infrastructural through our *Communication Design Quarterly* article that eventually developed into this book. We are grateful for ACM's expansive publications rights policy that encourages reuse and republishing.

We appreciate Derek Mueller for not only writing the foreword, which so generously ties together threads that we developed throughout this text, but for his feedback on our initial manuscript draft. We're confident that readers will appreciate your concise but rich synthesis, and stories, as much as we do!

Purdue's Wilke undergraduate research program provides opportunities for students to join faculty in their research: Teah Byford (*néé* Goode), Carissa Bauerband, Jeffrey Chen, Ean Hunt, Eva Voelker, Meagan Hipsky, and Nina Taylor offered insights and conversation at early stages of inquiry and helped us overlay structure on the chaos. Thank you for wading through early chapter drafts and sharing your thoughts. Although we were sad that removing the MFASCO example from Chapter 6 meant fewer kayaking references, we appreciate your confident honesty as early readers. You were right, the pizza metaphor worked better. Teah led the Wilke group in its second semester and created the images that accompany Kate's interview.

We are grateful to Hugh Burns who first included AI as a component of literacy. Matt Rowbotham and the local North Country Trail Association chapter, for clarifying the behind-the-scenes infrastructural work that goes into mapping and maintaining trails. Errata Corrigenda has worked her magic to give the book a visual identity as well as to remind readers of the important role of chance. Thanks to all of you. May there always be glitches.

Michael is always grateful for Tammy's support, encouragement, and patience as I work through muddled thoughts. Aila: writing with you is joy.

John thanks his Mom and Dad, Karen and Tim, for providing a soft landing on my return to the US, and for both protecting my writing time as well as my outdoor time to recenter. A special thanks as well to the many friends, family, colleagues, and professionals who stood by me in challenging times.

The Artificial Intelligence and Teaching Technical Communication conference, which Mark Crane and Bremen Vance organized, was formative in our discussions throughout writing this book. Stuart Selber kindly shared his keynote from the inaugural conference with us, and many of the presentations were thought provoking. We hope that this conference continues to be a regular gathering.

It feels decidedly odd to thank Stuart without Johndan Johnson-Eilola, who passed away while we wrote the text. His articulation of texts as little machines was inspirational in the thinking through of electracy.

Thanks also to Bill Hart-Davidson: our hearts are broken at the loss of Bill, without whom this project would have never begun. “Writing with Robots” made it possible to begin collaborating with AI. Give: when in doubt, give more.

Finally, while we acknowledge the convenient affordances of the technological infrastructure that supported our composing process, it is the *people* we acknowledge here—and you, the reader—who ultimately make this technorhetorical work meaningful.
